

Meng Zheng

✉ mengzhengrpi@gmail.com ☎ 518-833-4070

My research focuses on the design and development of interpretable deep learning systems and algorithms for a variety of computer vision and medical imaging applications, with particular focus on automated patient positioning and modeling, video analytics, image retrieval/person re-identification and generative modeling.

EDUCATION

Rensselaer Polytechnic Institute

PhD in Electrical Engineering, Adviser: Prof. Richard J. Radke, GPA: 3.94

Troy, NY

May 2020

Beijing Institute of Technology

Master of Science in Electrical Engineering, GPA: 3.89

Beijing, China

March 2016

Beijing Institute of Technology

Bachelor of Electrical Engineering, GPA: 3.90

Beijing, China

March 2013

WORK EXPERIENCE

United Imaging Intelligence

Cambridge MA

Senior Research Scientist

June 2020 – present

- Developed fully automated, contactless patient modeling and positioning systems for different types of medical scanners and smart scanning/operation rooms, e.g. Computed Tomography (CT), Molecular imaging (MI), Magnetic Resonance Imaging (MRI) or Digital subtraction angiography (DSA). The system assists scanners to automatically localize patient and adjust scanner pose for more efficient and accurate medical scanning (comparing to manual operation and competitive solutions), reduced patient's radiation intake, and minimized technician's risks w.r.t infectious diseases.
- Developed a novel 3D patient modeling and positioning deep learning-based algorithm, with a robust multi-modal (RGBD) patient body joint localization module and a self-supervised 3D mesh reconstruction module, which outputs a parameterized mesh representation of the patient body. The algorithm is robust to challenging real-clinical scanning/operating scenarios, e.g. the patient is heavily covered by surgical sheet or lead vest, that most of the existing solutions would significantly affected due to collapsed visual cues. The developed 3D mesh reconstruction algorithm does not require 3D mesh annotations for deep model training, which are essential to existing solutions and very expensive to collect, thus significantly reduces human labor effort and costs in real-clinical deployment.
- Developed a smart medical data annotation system with a novel weakly-supervised few-shot segmentation algorithm module, that is able to automatically propagate annotation from user-annotated data to unlabelled data without requiring intra-domain annotated training data, which sufficiently reduces user labeling time and effort comparing to conventional data annotation tools. The designed annotation algorithm is generic and applicable to different domains of medical data, e.g., brain MRI, lung CT data, etc.
- Developed vision-based head motion detection algorithm to automatically detect rigid movements of patient head and magnitude calculation, to diminish and compensate motion artifacts for Positron Emission Tomography - Computed Tomography (PET/CT) imaging and diagnose.

United Imaging Intelligence

Cambridge MA

Research Intern

May – August 2019

- Proposed the first gradient-based visual explanation technique for similarity CNN models, which can be applicable to a variety of vision-related applications including improved image retrieval, weakly-supervised few shot segmentation and automated patient pose guidance. The proposed method is generic and extensible in principle to any feature embedding CNN model.
- Designed the first deep architecture able to visually explain the model prediction of a certain patient pose (for positioning applications) as “correct” or “incorrect” to the reference poses.
- Designed a novel workflow to provide guidance to the patient to adjust their pose according to the selected scanning protocols for better medical imaging quality based on the generated visual explanations.

Rensselaer Polytechnic Institute

Troy NY

Graduate Research & Teaching Assistant

Aug 2016 – May 2020

- Substantial experience in building practical real-world systems for the problem of person re-identification (re-id)
- Designed new re-id algorithms to recover person trajectories in a multi-camera network, learning temporal models corresponding to inter-camera transition patterns, thereby improving accuracy in conjunction with novel search space pruning strategy to improve re-identification accuracy.
- Designed a novel video-based re-id CNN model with 3D gradient-based attention; this was the first 3D CNN-based architecture able to generate spatiotemporal localization given person class label information.
- Designed a novel two-branch architecture for image-based re-id that produces attentive regions during training without requiring any additional supervision other than identity labels or any specially-designed architecture for modeling attention.
- My work also involved collecting and annotating new datasets for the use of the research community; collected a new multi-shot multi-camera large scale re-id dataset, called RPIfield, which provides explicit time-stamp information for each candidate. The RPIfield dataset allows the study of re-id algorithms in a more general context, especially with respect to temporal aspects.
- For practical applicability, I extensively studied temporal aspects of the person re-id problem; Developed a new evaluation methodology for re-id called the Rank Persistence Curve (RPC), which provides temporal rank information derived by a re-id algorithm, showing how long a correct match to the probe is likely to stay in the rank-k shortlist
- Also have experience in the design and development of generative models; extensively studied various learning and inference algorithms for deep regression Bayesian networks under both supervised and unsupervised settings for image inpainting, image denoising, and head pose and eye gaze estimation.

CVPR, **ICCV**, **BMVC** and **WACV** are top conferences in computer vision research field. CVPR, ICCV are ranked # 4 and # 31 respectively on Google Scholar Metrics overall top publications ranking. CVPR, ICCV, BMVC and WACV are ranked # 1, # 3, # 10 and # 12 respectively on Computer Vision and Pattern Recognition top publications. **MICCAI** and **IJCAI** are top conferences in radiology and medical imaging, and artificial intelligence research field. MICCAI is ranked #6, IJCAI is ranked #9 in Google Scholar top publications in radiology and medical imaging, and artificial intelligence category respectively.

AWARDS

- Allen B. Dumont Prize – Rensselaer Polytechnic Institute, 2020. This prize is awarded to a graduate student who has demonstrated high scholastic ability and has made a substantial contribution to that field.
- Outstanding Graduates – Beijing Institute of Technology, 2013.
- Outstanding Student – Beijing Institute of Technology, 2012.
- Outstanding Student Scholarship – Beijing Institute of Technology, 2009, 2010, 2011, 2012.
- Talent Class Scholarship – Beijing Institute of Technology, 2009, 2010, 2011, 2012.
- Excellent Class Performance scholarship – Beijing Institute of Technology, 2009, 2010, 2011.
